Conservis is the world leader in farm management software, helping growers track field activities, manage inventories, and analyze yields. We helped them expand and refine their powerful suite of products, including a mobile app and new tools for analyzing financial data.

If essential data on a farm comes from the field, why not capture it right there? We designed a mobile app that keeps every worker updated on what needs to be done while enabling them to log their own progress as they work. With real-time data on production activities like planting and irrigation, all the way to harvest yields and grain storage, a grower can keep tabs on every single acre. When we started designing a dashboard for Conservis, the growers we talked to needed actionable data specific to their fields, crops, yield per acre, and conditions. Even when working on planning and accounting from their office, growers think about their operation field by field. To match their workflow, we designed a dashboard with a map at its core, so it's easy to see how the latest numbers connect to a real place.

With 100 percent adoption, all Conservis growers now use the dashboard in farms across North America, Australia, and South America. Every farmer is unique, and their dashboards are personalized. Some rotate crops, some change their mix of crops, and all of them will ultimately change their focus throughout the year and year to year. As seasons change, so

must widgets and dashboards. During handoff, we left the Conservis team with the documentation and ability to make their own new widgets as needed. Even for the most successful growers, frequent loan applications are a fact of life in the modern agriculture business. That means translating handshake land agreements and bushels per acre into the kind of financial data a banker needs. The custom budget reports we designed leverage all the data in a grower's Conservis account, from fertilizer costs to commodity prices. All it takes is a few clicks to bundle everything into a clean and organized, print-friendly PDF, ready to hand off to a lender.

Two Stats or Fun Facts?:

1. **100%**

dashboard adoption

2. **Essential data bundled**

into a bank-friendly document.
